Context and Goal

- Uncertainty estimation is important in LCA, especially when comparing product alternatives

- Question : what is the main source of uncertainty in LCA : the process itself or upstream and downstream processes?

- Analysis of 09 construction products in Brazil

Methods

- LCI : product manufacturing - primary data collection (factory / literature) | upstream and downstream - Ecoinvent 3.2 global datasets
- Data quality assessment : Pedigree matrix universe: 01 factory (EPD)
- LCIA : IPCC 2013 - 100 years' timeframe
- GWP coefficient of variation : Monte Carlo sampling with 10.000 interactions
- CV distribution between itself and upstream / downstream processes : ANOVA

Construction products

Materials extraction Materials manufacturing Product manufacturing

cradle-to-gate

Results

CV of GWP (%)	Upstream or downstream (%)	Process itself (%)	
10.4	78	22	Clay block
21.1	95	5	Sand
15.1	65	35	Gravel
13.0	82	18	Concrete block
21.8	97	3	Concrete
18.2	78	22	Mortar
9.5	60	40	Acrylic painting
18.3	13	87	Sawnwood (native)
16.5	23	77	Sawnwood (planted)

Main contributors to uncertainty

Conclusions

- CV values for GWP indicator range from 9,5% to 21,1% - importance of considering uncertainty in LCA studies
- Upstream processes are a major uncertainty source in LCA of construction products
- Improving data quality of construction products requires better data for upstream processes: importance of a national database to increase LCA reliability
- Main upstream contributors: can help to define priorities for data collection
