Contents

Foreword ix

Acknowledgements xi

Chapter 1. Introduction 1

1.1. SPH method 3
1.2. RKPM method 5
1.2.1. Conditions of reproduction 6
1.2.2. Correction of the kernel 7
1.2.3. Discrete form of the approximation 9
1.3. MLS based approximations 10
1.4. Final note 11

Chapter 2. Basics of the Natural Element Method 13

2.1. Introduction 13
2.2. Natural neighbor Galerkin methods 14
2.2.1. Interpolation of natural neighbors 14
2.2.2. Discretization 18
2.2.3. Properties of the interpolant based on natural neighbors 19
2.3. Exact imposition of the essential boundary conditions 22
2.3.1. Introduction to alpha shapes 23
2.3.2. CNEM approaches 25
2.4. Mixed approximations of natural neighbor type 27
2.4.1. Considering the restriction of incompressibility 28
2.4.2. Mixed approximations in the Galerkin method 32
2.4.3. Natural neighbor partition of unity 33
2.4.3.1. Partition of unity method 33
2.4.3.2. Enrichment of the natural neighbor interpolants 35

2.5. High order natural neighbor interpolants 40
2.5.1. Hiyoshi–Sugihara interpolant 40
2.5.2. The De Boor algorithm for B-splines 43
2.5.3. B-spline surfaces and natural neighboring 44
2.5.3.1. Some definitions 44
2.5.3.2. Surface properties 47
2.5.3.3. The case of repeated nodes 47

Chapter 3. Numerical Aspects 49

3.1. Searching for natural neighbors 49
3.2. Calculation of NEM shape functions of the Sibson type 52
3.2.1. Stage-1: insertion of point x in the existing constrained Voronoi diagram (CVD) 55
3.2.1.1. Look for a tetrahedron which contains point x 55
3.2.1.2. Note concerning the problem of flat tetrahedrons 55
3.2.2. Stage-2: calculation of the volume measurement common to $\acute{c}_x$ and c_v 57
3.2.2.1. By the recursive Lasserre algorithm 57
3.2.2.2. By means of a complementary volume 60
3.2.2.3. By topological approach based on the CVD 62
3.2.2.4. By topological approach based on the Constrained Delaunay tetrahedization (CDT) 65
3.2.2.5. Using the Watson algorithm 66
3.2.3. Comparative test of the various algorithms 70
3.3. Numerical integration 71
3.3.1. Decomposition of shape function supports 71
3.3.2. Stabilized nodal integration 73
3.3.3. Discussion in connection with various quadratures 74
3.3.3.1. 2D patch test with a technique of decomposition of shape function supports 74
3.3.3.2. 2D patch test with stabilized nodal integration 75
3.3.3.3. 3D patch tests 77
3.4. NEM on an octree structure 80
3.4.1. Structure of the data 82
3.4.1.1. Description of the geometry 82
3.4.1.2. Interpolation on a quadtree 85
3.4.1.3. Numerical integration 85
3.4.2. Application of the boundary conditions – interface conditions 87
3.4.2.1. Dirichlet-type boundary conditions: use of R-functions . . . 87
3.4.2.2. Neumann-type boundary conditions 90
3.4.2.3. Partition of unity method 90

Chapter 4. Applications in the Mechanics of Structures and Processes . . . 93

4.1. Two- and three-dimensional elasticity 93
4.2. Indicators and estimators of error: adaptivity 96
4.2.1. Meshless methods and adaptation 96
4.2.2. Methodology of adaptive refinement for linear elasticity in statics 98
4.2.2.1. Formulation in static linear elasticity 99
4.2.2.2. The first indicator based on the rebuilding of discontinuous stress fields 102
4.2.2.3. The second indicator based on the rebuilding of continuous fields of strain 103
4.2.2.4. Refinement strategy based on Voronoi cells 105
4.3. Metal extrusion 107
4.3.1. Viscoplastic model for the extrusion of aluminum 108
4.3.2. 3D simulation of the extrusion of a cross-shaped profile 111
4.4. Friction stir welding 113
4.4.1. Constitutive equation 117
4.4.1.1. Mechanical model 118
4.4.2. Numerical results 120
4.5. Models and numerical treatment of the phase transition: foundry and treatment of surfaces 123
4.5.1. Introducing motion discontinuity 123
4.5.1.1. Formulation of the thermal problem with phase transition 124
4.5.1.2. CNEM discretization 126
4.6. Adiabatic shearing, cutting, and high speed blanking 136
4.6.1. General context of the implementation of the large transformations 140
4.6.1.1. Updated Lagrangian formulation 141
4.6.1.2. Processing the additional points 141
4.6.1.3. Time integration scheme 142
4.6.1.4. Processing of the contact 142
4.6.1.5. Integration of the constitutive equation 142
4.6.2. Applications 145
4.6.2.1. Taylor's bar 145
4.6.2.2. Adiabatic shearing 148
4.6.3. Conclusions on the numerical simulation of shearing 158

Chapter 5. A Mixed Approach to the Natural Elements 159

5.1. Introduction 159
5.2. The Fraeijs de Veubeke variational principle for linear elastic problems 161
5.3. Field decomposition 164

5.4. Discretization 166
5.5. Discretized equations 170
5.6. Matrix solution for linear elastic problems 172
5.7. Numerical integration 176
5.8. Linear elastic patch tests 178
5.9. Application 1: pure bending of a linear elastic beam 182
5.10. Application 2: square domain with circular hole 185
5.11. Mixed approach to nonlinear problems 187
5.12. Step-by-step solution of the discretized nonlinear equations 192
5.13. Example of an elastoplastic material 195
5.14. Application: pure bending of an elastoplastic beam 196
5.15. Conclusion 199

Chapter 6. Flow Models 201

6.1. Natural element method in fluid mechanics: updated Lagrangian approach 201
6.1.1. Mechanical model of a Newtonian fluid flow 201
6.2. Free and moving surfaces 202
6.2.1. Use of the characteristics method 204
6.3. Short-fiber suspensions flow 206
6.3.1. Flow kinematics 207
6.3.2. Coupling of a particle method with α-NEM 208
6.4. Breaking dam problem 208
6.5. Multi-scale approaches 209
6.5.1. Mechanical model 214
6.5.1.1. FENE model 216
6.5.1.2. Doi–Edwards model 217
6.5.2. Integration of the model 218
6.5.2.1. Functional approximation 218
6.5.2.2. Discretization of the model 218
6.5.2.3. Resolution algorithm 219
6.5.3. Some results 220
6.5.3.1. Startup of a simple shear flow of an FENE fluid model . . . 220
6.5.3.2. Flow from an extrusion die and FENE-fluid 220
6.5.3.3. Startup of a simple shear flow of a Doi–Edwards fluid model 223

Chapter 7. Conclusion 225
